## 1 Introduction

We are going to work with dataset bank-additional-full.csv with all examples (41188) and 20 inputs, ordered by date (from May 2008 to November 2010), very close to the data analyzed in [Moro et al., 2014].

Deliverables are concerned with Multivariant Data Analysis and model building for response variables: Y-Duration of the call and binary factor Y (Binary Target) if the product (bank term deposit) would be ('yes') or not ('no') subscribed.

## 1.1 Bank client data

## 1.1.1 Description

Input variables:

- 1. age (numeric)
- 2. job: type of job (categorical: 'admin.', 'blue-collar', 'entrepreneur', 'housemaid', 'management', 'retired', 'self-employed', 'services', 'student', 'technician', 'unemployed', 'unknown')
- 3. marital : marital status (categorical: 'divorced', 'married', 'single', 'unknown'; note: 'divorced' means divorced or widowed)
- 4. education (categorical: 'basic.4y', 'basic.6y', 'basic.9y', 'high.school', 'illiterate', 'professional.course', 'university.degree', 'unknown to be a control of the con
- 5. default: has credit in default? (categorical: 'no', 'yes', 'unknown')
- 6. housing: has housing loan? (categorical: 'no', 'yes', 'unknown')
- 7. loan: has personal loan? (categorical: 'no', 'yes', 'unknown')# related with the last contact of the current campaign:
- 8. contact: contact communication type (categorical:'cellular', 'telephone')
- 9. month: last contact month of year (categorical: 'jan', 'feb', 'mar',..., 'nov', 'dec')
- 10. day\_of\_week: last contact day of the week (categorical:'mon','tue','wed','thu','fri')
- 11. duration: last contact duration, in seconds (numeric). Important note: this attribute highly affects the output target (e.g., if duration=0 then y='no'). Yet, the duration is not known before a call is performed. Also, after the end of the call y is obviously known. Thus, this input should only be included for benchmark purposes and should be discarded if the intention is to have a realistic predictive model.
- 12. campaign: number of contacts performed during this campaign and for this client (numeric, includes last contact)
- 13. pdays: number of days that passed by after the client was last contacted from a previous campaign (numeric; 999 means client was not previously contacted)
- 14. previous: number of contacts performed before this campaign and for this client (numeric)
- 15. poutcome: outcome of the previous marketing campaign (categorical: 'failure', 'nonexistent', 'success')# social and economic context attributes
- 16. emp.var.rate: employment variation rate quarterly indicator (numeric)
- 17. cons.price.idx: consumer price index monthly indicator (numeric)
- 18. cons.conf.idx: consumer confidence index monthly indicator (numeric)
- 19. euribor3m: euribor 3 month rate daily indicator (numeric)
- 20. nr.employed: number of employees quarterly indicator (numeric)
- 21. y has the client subscribed a term deposit? (binary: 'yes', 'no')

Segons criteri de Khaiser realitzarem la interpretació de les 3 primeres dimensions, ja que la quarta ja te un egigenvalue menor a 1.

```
barplot(res.pca$eig[,1], col = "yellow", main= "Eigenvalue")
```

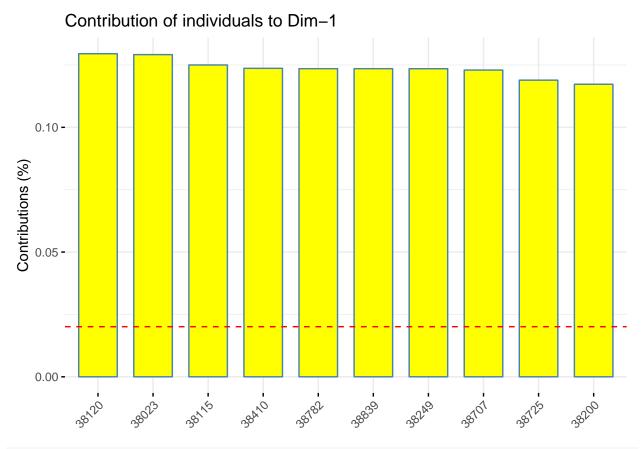

## Eigenvalue

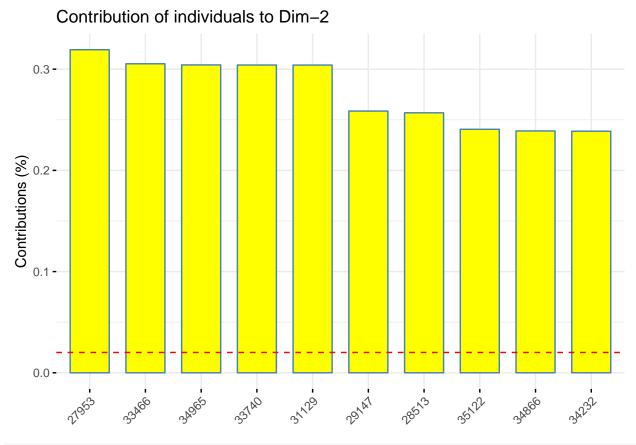

En canvi, interpretariem 6 dimensions per Elbow's rule ja que notem una baixada considerable en a partir de la component numero 7.

### 7.2 Individuals point of view

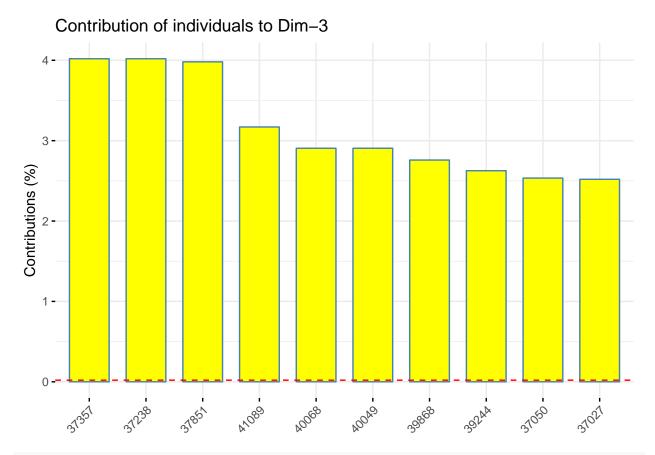

```
#Individus que contribuieixen més a la dimensió 1
fviz_contrib(res.pca, choice = "ind", top = 10, fill = "yellow", axes = 1); # Dimensió 1
```

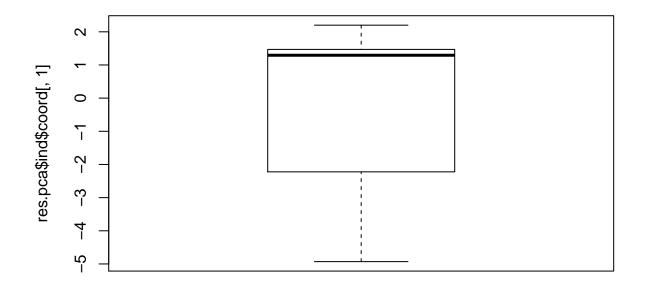

#Individus que contribuieixen més a la dimensió 2 fviz\_contrib(res.pca, choice = "ind", top = 10, fill = "yellow", axes = 2); # Dimensió 2

#Individus que contribuieixen més a la dimensió 3
fviz\_contrib(res.pca, choice = "ind", top = 10, fill = "yellow", axes = 3); # Dimensió 3

#Ara observem els individus més extrems del nostre data frame.
indiv\_out.d1<-Boxplot(res.pca\$ind\$coord[,1]); indiv\_out.d1; # Dimensió 1

```

En la dimensió 3 en canvi podem veure que les coordenades més extremes ens apareixen en individus amb un nivell educatiu superior, que han estat previament contactats, amb una hipoteca i que han estat contactats durant la temporada d'estiu.

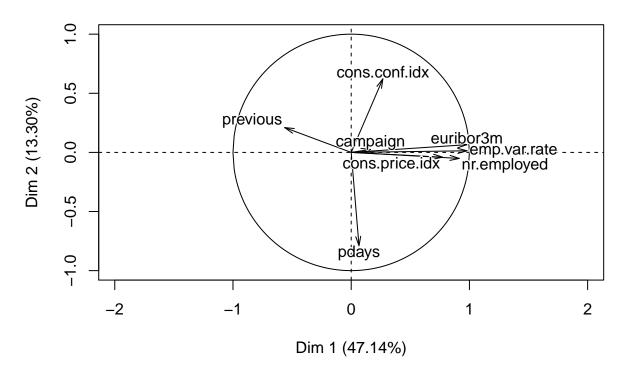

Tornem a realitzar el calcul dels PCA ara tenint en compte que els nostres individus considerats outliers de la mostra, realitzaran la funció d'individus suplementaris:

newres.pca <- PCA(df[,vnum], ind.sup = c(indiv\_sup.d2, indiv\_sup.d3))</pre>

## **Variables factor map (PCA)**

Podem veure que en utilizar els otuliers indivius com a individus suplmenetaris els eigenvalues canvien significativament modificant inclús el nombre de dimensions necessaries per a la correcta interpretació de les dades.

```
summary(newres.pca, nb.dec = 2, nbelements = 10)
```

```
##
## Call:
## PCA(X = df[, vnum], ind.sup = c(indiv_sup.d2, indiv_sup.d3))
##

```

Pel que fa a la primera dimensió, les variables socioeconòmiques son les que ens mostren una major coorrelació. Per altra banda veiem que el nombre de contactes efectuats abans de l'ultim contacte té una relació negativa amb el primer eix.

Pel que fa a la segona dimensió, el més destacable és la relació inversament proporcional que el segon eix de coordenades té amb el numero de dies que han passat des de l'ultim contacte.

En canvi el tercer eix de dimensions està altament relacionat amb el numero de vegades que un clientha estat conatctat durant aquesta campanya.

plot(opt, type = "b")
abline(v = 8, col = "red")</pre>
```

Com podem comprovar en el gràfic de forma visual, trobem un pic en el moment en que el nombre de clusters és optim. En aquest cas n'utilitzarem 7.

#### 8.1 Description of clusters

```
set.seed(676489)
def <- kmeans(res.pca$ind$coord[,1:3], centers = 8)
df$kmeansclu<-factor(def$cluster)

vclust <- c(vfact, vnum, "kmeansclu")
targ <- which(vclust == "kmeansclu")</pre>
```

```
catdes(df[,vclust], targ)

Cluster 1: Es troba la gent jove treballadora que han sigut prèviamnet contactats

Cluster 2: Individus que han estat prèviamnet contactats i d'edat avançada.

Cluster 3: En aquest cas és difícil veure un patró que tots els individus segueixin.

Cluster 4: En aquest cluster es troba la gent jove que treballa com a autònom.

Cluster 5: Hi trobam individus que no són d'edat avançada, contactats durant la tardor-hivern i que estàn divorciats.

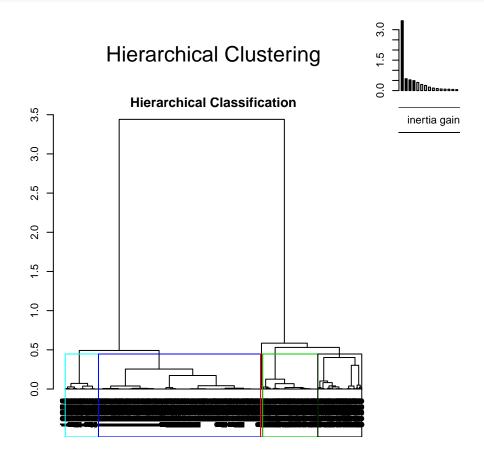

Cluster 6: Aquest cluster segueix la línia del tercer, ja que no es pot veure un patró clar a simple vista.

Cluster 7: Hi podem trobar individus que no són ancians (fins els 50 anys) que no han estat previament contactats.

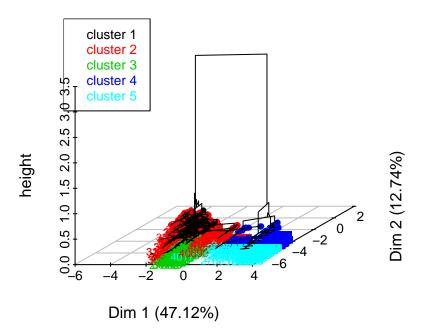

## 9 Hierarchical Clustering

Després de comprovar el nombre optim de cluster a definir interaccionant amb el plot, hem vist que és 5.

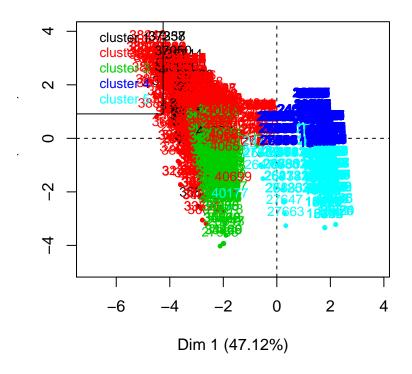

clust <- HCPC(res.pca, nb.clust = 5, order = TRUE)</pre>

```

En la divisió de clusters per les seves variables podem trobar dos primers clusters altament relacionats amb la variable previous, persones que havien estat contactades anteriorment. En el cas del primer, també es important veure la relació que el cluster té amb els dies que han passat des de l'ultim contacte. Del segon cluster també obtenim relacions socioeconòmiques negatives i amb una important presència.

Per altra banda el cluster numero 3 unicament obté relacions en el sentit negatiu i principalment de variables socioeconòmiques. Totalment el contrari que el cluster numero 4.

Acabem amb el cluster 5. En aquest cas els individus majoritariament havien estat contactats més d'una vegada durant la campanya actual, aquests tambñe gaudeixen d'una relació positiva amb les variables socioeconòmiques.

Pel que fa als eixos resumidament podem dir que el cluster numero 1 està ben representat en la dimensió 3 i 4. El cluster 2 està ben representat en la dimensió 2,4 i 5 però molt malt repsentat en la dimensió 1. Seguidament el cluster 3 veiem que estpa mal representat en totes les dimensions existents. El 4 gaudeix de bona representació en les dues primeres dimencions. I per acabar el cluster numero 5 gaudeix de bona

representació en la dimensió 4 i 1 per contra no li beneficia la dimensió 2.

## 10 CA analysis

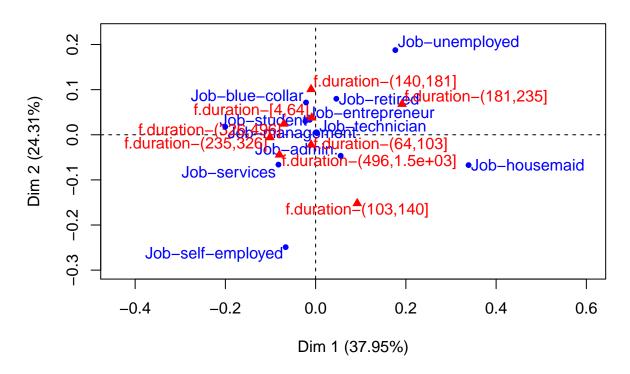

Per a realitzar l'anàlisis de correspondència simples utilitzarem dos factors sorgits de la neteja de les dades. En aquest cas farem l'estudi amb el factor f.jobsituation i el factor f.age.

#### 10.1 f.duration - f.job

```
t <- table(df$f.job, df$f.duration); t;

  Pearson's Chi-squared test
##
##
## X-squared = 108.72, df = 70, p-value = 0.002084
t \leftarrow CA(t)
```

## **CA** factor map

Com que el p-value és més petit que 0,05 rebutgem la hipòtesis de independència entre els dos factors. Trobem una certa relació entre les trucades amb més durada i els treballadors en el sector dels serveis. Per altre banda, retirats i estudiants son els que més relació tenen amb les trucades curtes.

```

Destaquem que la dimensió 3 i 4 realitzen una representació molt lleu de les nostres dades. En canvi la dimensió 1 té en compte les trucades de durada mitjana i en canvi en la tercera dimensió i juguen un paper bastant important les trucades de major durada de la mostra.

## data: t
## X-squared = 83.826, df = 14, p-value = 5.487e-12
t \leftarrow CA(t)
```

## **CA** factor map

Com que el p-value és més petit que 0,05 rebutgem la hipòtesis de independència entre els dos factors. En conjunt podem veure que al voltant de la primavera es situen les trucades amb una durada superior. En canvi, a l'estiu passa totalment el contrari.

#### 10.2.1 Eigenvalues and dominant axes analysis

t\$col\$cos2[,1:2]

En aquest punt escollim utilitzar les dues uniques dimensión per a poder fer-ne una posterior valoració.

```
##
                                 Dim 1
                                              Dim 2
## f.duration-[4,64]
                             0.9225859 0.0774141059
## f.duration-(64,103]
                             0.9642447 0.0357552505
## f.duration-(103,140]
                             0.9525546 0.0474454013
## f.duration-(140,181]
                             0.2014826 0.7985173967
## f.duration-(181,235]
                             0.8427807 0.1572192538
## f.duration-(235,326]
                             0.9995529 0.0004471099
## f.duration-(326,496]
                             0.8066524 0.1933475905
## f.duration-(496,1.5e+03] 0.1932805 0.8067194776
```

Tot i que la primera dimensió representa en gran escreix la major part de les dades, podem comentar que en la dimensió numero dos es veuen molt millor representades les trucades amb una major durada i també les de

durades intermitges.
